

Tutorial 5

- Show all working!
- For conditional probabilities, make sure you know how to get this around the right way
 - What are you trying to find out about the situation (A) and what do you already know about the situation (B)
 - $P(A|B)$, probability of A given B
- For Bayes rule questions, list all of the probabilities and conditional probabilities that you know first, then state what you are trying to find, then apply the appropriate equations
