caymag: a Cayley to MAGMA translator

The program `caymag` translates Cayley files into MAGMA. To run `caymag` on `infile` and put output in `outfile` type

```
caymag < infile > outfile
```

It's not guaranteed to work completely but it seems to do most of the work -- what it can't translate you may have to do by hand. To get the manual, which is a plain ASCII file, just type

```
caymag -h
```

Depending on what your `PAGER` environment variable is set to, you may need to pipe this through `more` to avoid whooshing straight through the file, i.e. you may need to type

```
caymag -h | more
```

If `caymag` returns the error message

```
Not enough memory.
```

`rlogin` to a less-used machine and try again.
