Cayley/MAGMA: Libraries and data bases

Have you used any of the libraries in Cayley? If so, they have been converted to MAGMA format. Since MAGMA V1.01-5, a few of the library names have changed and the data contained in those libraries is now accessed via functions ... the Cayley library `irredsol` has become `isolgps -- type`

```
?isolgps
```

while running a MAGMA session to find out what these functions are. (This is a vast improvement, since the user now has control over where and how returned values are stored.) The library `prmgps` has been changed in a similar fashion without a name change.
